Upon ligand activation through the released notch intracellular domain (NICD) it forms a transcriptional activator complex with RBP-J kappa and activates genes of the enhancer of split locus. Affects the implementation of differentiation, proliferation and apoptotic programs. May be important for normal lymphocyte function. In altered form, may contribute to transformation or progression in some T-cell neoplasms. Involved in the maturation of both cD4+ and CD8+ cells in the thymus (By similarity). SUBUNIT: Heterodimer of a C-terminal fragment N(TM) and a N-terminal fragment N(EC) which are probably linked by disulfide

                                                                                                                                                                                                                                                                     which is proteolytically cleaved by a furin-like convertase in the trans-golgi network before it reaches the plasma membrane to yield an active, ligand-accessible form. Cleavage results in a C-terminal fragment N(TM) and a N-terminal fragment N(EC). Following ligand binding, it is cleaved by TNT-alpha converting enzyme (TACE) to yield a membrane-associated intermediate fragment called notch extracellular truncation (NEXT). This fragment is then cleaved by presentlin dependent gamma-secretase to release a
                                                                                                                                                                                                                                                                                                                                                                                                                                                         brain stem and lung. Also present in most adults found mainly in lymphoid tissues. PTM: Synthesized in the endoplasmic reticulum

EMBO J. 6:761-766(1987).

1- FUNCTION: MAY PLAY A ROLE IN THE DEVELOPMENT O
POSSIBLY FOR THE ESTABLISHMENT AND/OR MAINTENA
POLARITY. IT MAY ACT AS A SIGNAL.

1- SUBCELLULAR LOCATION: Type I membrane protein.

1- PTM: PHOSPHORYLATED IN THE CYTOPLASMIC DOMAINS.

1- SIMILARITY: CONTAINS 29 EGF-LIKE DOMAINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Drosophila melanogaster (Fruit fly).

DEVELOPMENTAL STRGE: Expressed in all cells in pregastrulation stages. During gastrulation is differentially expressed, accumulating predominantly in the prechordal mesoderm and notochord. At the end of gastrulation, expressed along the anterior-posterior axis including the developing neural plate and differentiating mesoderm. Also present in the developing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              EMBRYO DEVELOPMENT, MAY BE INVOLVED IN THE NEURAL PLATE, NOTOCHORD AND BRAIN VESICLES.

                      FUNCTION: Functions as a receptor for membrane-bound ligands Jagged2 and Deltal to regulate cell-fate determination. Upon ligand activation through the released notch intracellular domain (NICD) it forms a transcriptional activator complex with RBP-J kappa and activates genes of the enhancer of split locus. Affects the implementation of differentiation, proliferation and apoptotic programs (By similarity). May play an essential role in postimplantation development, probably in some aspect of cell specification and/or differentiation. May be involved in mesoderm

THE PROPERTY OF THE PROPERTY O

bonds (By similarity).
SUBCELLULAR LOCATION: Type SUBUNIT: Heterodimer of a C-terminal fragment N(TM) and a terminal fragment N(EC) which are probably linked by disul and a N-' disulfide

proteolytical processing NICD I membrane protein. is translocated ç Following the nucleus (Ву

and, in early postnatal central nervous system (CNS) germinal zones of the CNS. Found in both subventricular and ventricular germinal zones. DEVELOPMENTAL STAGE: In the embryo, highest levals comes. TISSUE SPECIFICITY: Expressed in the brain, 14 and decrease rapidly to much levels occur lower levels kidney and spleen in the

cleaved by presentiin dependent yamma-secretase to release notch-derived peptide containing the intracellular domain (from the membrane (By similarity).

PTM: Phosphorylated (By similarity).

SIMILARITY: BELONGS TO THE NOTCH FAMILY.

SIMILARITY: CONTAINS 36 EGF-LIKE DOMAINS.

SIMILARITY: CONTAINS 3 LIN/NOTCH REPEATS.

SIMILARITY: CONTAINS 5 ANK REPEATS. which is proteolytically cleaved by a furin-like converged which is proteolytically cleaved by a furin-like converged which is proteolytically cleaved by a furin-like converged trans-Golgi network before it reaches the plasma membrane to yield an active, ligand-accessible form. Cleavage results in a C-terminal fragment N(EC). Following ligand binding, it is cleaved by TNT-alpha converting enzyme (TACE) to yield a membrane-associated intermediate fragment called notch extracellular truncation (NEXT). This fragment is then notch extracellular truncation (NEXT). This fragment is then notch extracellular truncation (NEXT). Synthesized in the endoplasmic reticulum as an inactive form is proteolytically cleaved by a furin-like convertase in the s-Golgi network before it reaches the plasma membrane to yield s-Golgi network before the yield s-Golgi

RY Mizutani T., Taniguchi Y., Aoki T., Hashimoto N., Itanisma Of Signal transcriptional activation ligands of the released notch intracellular or domain (NICD) it forms a transcriptional activator complex with CCC domain (NICD) it forms a transcriptional activator complex with CCC RBP-J Kappa and activates genes of the enhancer of split locus.

CC RBP-J Kappa and activates genes of the enhancer of split locus.

CC Affects the implementation of differentiation, proliferation and apoptotic programs (By similarity). May play an essential role in specification and/or differentiation.

CC postimplantation development, probably in some aspect of cell postimplantation and a C-terminal fragment N(TM) and a N-terminal fragment N(EC) which are probably linked by disulfide of Subcellular Location. Type I membrane protein. Following proteolytical processing NICD is translocated to the nucleus.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               plasma membrane
                                                                                                                                                                                                                                                                                                                                                                                                                                         trans-Golgi network before it reaches the plasma membrane to yield an active, ligand-accessible form. Cleavage results in a C-terminal fragment N(TM) and a N-terminal fragment N(EC). Following ligand binding, it is cleaved by TNF-alpha converting enzyme (TACE) to yield a membrane-associated intermediate fragment called notch extracellular truncation (NEXT). This fragment is then cleaved by presentin dependent gamma-secretase to release a notch-derived peptide containing the intracellular domain (NICD) from the membrane (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Affects the implementation of differentiation, prolifera apoptotic programs (By similarity).

Jagged1, Jagged2 and Deltal to regulate cell-fate determination. Upon ligand activation through the released notch intracellular domain (NICD) it forms a transcriptional activator complex with RBP-J kappa and activates genes of the enhancer of split locus. Affects the implementation of differentiation, proliferation and apoptotic programs. May play an essential role in postimplantation development, probably in some aspect of cell specification and/or differentiation (By similarity).

SUBUNIT: Heterodimer of a C-terminal fragment N(TM) and a N-terminal fragment N(EC) which are probably linked by disulfide bonds (By similarity).

SUBCELIULAR LOCATION: Type I membrane protein. Following proteolytical processing NICD is translocated to the nucleus.

TISSUE SPECIFICITY: Highly expressed in the spleen and choroid plexus in the brain. Expressed in postnatal central nervous system (CNS) germinal zones and, in early postnatal life, within numerous ventricular germinal zones. Also found in the heart, liver and kidney.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Rattus norvegicus (Rattus norvegicus (Ratus norvegicus); Eukaryota; Metazoa; (Mammalia; Eutheria; IMCBI_TaxID=10116;

from the membrane (By similarity).
PTM: Phosphorylated (By similarity).
SIMILARITY: BELONGS TO THE NOTCH FAMILY.
SIMILARITY: CONTAINS 35 EGF-LIKE DOMAINS.
SIMILARITY: CONTAINS 2 LIN/NOTCH REPEATS.
SIMILARITY: CONTAINS 6 ANK REPEATS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   trans-Golgi network before it reaches the plasma membrane to yield an active, ligand-accessible form. Cleavage results in a C-terminal fragment N(TM) and a N-terminal fragment N(EC). Following ligand binding, it is cleaved by TNF-alpha converting enzyme (TACE) to yield a membrane-associated intermediate fragment called notch extracellular truncation (NEXT). This fragment is then cleaved by presentin dependent gamma-secretase to release a notch-derived peptide containing the intracellular domain (NICD)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    E; PS50068; ANK_REPEAT; 4.

"Many cell types specified by Notch function.";
Curr. Biol. 1:120-122(1991).
-i-FUNCTION: Functions as a receptor for membrane-bound ligands Delta and Serrate to regulate cell-fate determination. Upon ligand activation through the released notch intracellular domain (NICD) it forms a transcriptional activator complex with Su(H).
                                                                                                                                                             This

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           POST-TRANSLATIONAL PROCESSING
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               PTM: Synthesized in the endoplasmic reticulum as an inactive form which is proteolytically cleaved by a furin-like convertase in the trans-Golgi network before it reaches the plasma membrane to yield an active, ligand-accessible form. Cleavage results in a C-terminal fragment N(TM) and a N-terminal fragment N(EC). Following ligand binding, it is cleaved by TNF-alpha converting enzyme (TACE) to yield a membrane-associated intermediate fragment called notch extracellular truncation (NEXT). This fragment is then cleaved by presenilin dependent gamma-secretase to release a notch-derived peptide containing the intracellular domain (NICD)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           FUNCTION: Functions as a receptor for membrane-bound ligands Jaggedl Jaggedl and Deltal to regulate cell-fate determination. Upon ligand activation through the released notch intracellular domain (NICD) it forms a transcriptional activator complex with RBP-J kappa and activates genes of the enhancer of split locus. Affects the implementation of differentiation, proliferation and apoptotic programs (By similarity). May regulate branching morphogenesis in the developing vascular system.

SUBUNIT: Heterodimer of a C-terminal fragment N(TM) and a N-terminal fragment N(EC) which are probably linked by disulfide

The conotoxins are used for treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel, especially cardiac ischaemia, cerebral ischaemia, ocular ischaemia and asthma. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Treating disorders associated with radical depolarization of excitable membrane e.g. cardiac, cerebral and ocular ischaemia and asthma comprises activating a KATP channel by administering to an individual comprises.
